

An AI operating system for sports video

Upload any match → tactical analysis, auto-highlights, predictions, and searchable insight.

Powered by RunPod Flash · serverless GPU microservices

The problem

Coaches, broadcasters, analysts, and creators **drown in raw footage**.

- A 90-minute match = hours of manual review for a few key moments.
- Existing AI tools are **single-purpose** — one app per task, per sport.
- Nothing composes vision + audio + text into one **tactical narrative**.

“ What if every uploaded video became a queryable intelligence layer? ”

The vision — one platform, many AI services

Not a video analyzer. A modular AI OS for sports video.

Highlights

Tactical Coach

Live Prediction

Match Summary

NL Video Search

Tactical Chat

Dataset Factory

Multimodal Fusion

Rail / Industrial

Each service is **independent**, **composable**, and **sport-agnostic** — soccer today, basketball, tennis, esports, or railway inspection tomorrow.

Why RunPod Flash

Each capability = an independent **serverless GPU** **@Endpoint**.

```
@Endpoint(name="player_detect",  
          gpu=GpuType.NVIDIA_GEFORCE_RTX_4090,  
          dependencies=["ultralytics", "opencv-python-headless"])  
async def detect_objects(frames): ...
```

- **Parallel** — spin up only the services a request needs.
- **Scale-to-zero** — no idle cost; RTX 4090 ≈ **\$0.34/hr**.
- **No Dockerfiles** — **flash deploy**, one endpoint per function.

Architecture — one pattern, every service

extract → analyze → compose → narrate — reused by all 9 services.

MVP shipped — 2 features, real architecture

1a · AI Highlight Generator

Audio energy + commentary → **top-10 labeled clips** + timeline.

Mostly CPU; Whisper + LLM labels via Flash GPU + existing vLLM endpoint.

1b · Player & Ball Detection

YOLO on RTX 4090 → **annotated overlay video** + on-screen stats.

First GPU batch-inference endpoint — reused by tracking, pose, segmentation.

Both lay down the skeleton every later service plugs into.

Live demo flow

1. **Upload** `match.mp4` in the dashboard.
2. Highlights appear as the pipeline runs:

▶	00:05:23	Goal
▶	00:18:17	Bicycle kick
▶	00:46:02	Great save
▶	01:21:55	Winning goal

3. Switch tab → **annotated detection overlay** (players + ball).
4. (Optional) **Bright Data** scrapes the real match report to cross-label events.

Roadmap

Phase	Service	Adds
✓ 1	Highlights + Detection	the reusable pipeline
2	Match Summary	timeline → exec report (LLM)
3	Tactical Coach	tracking, formation, heatmaps
4	Search + Chat	frame embeddings, retrieval
5	Live Prediction	xG / win-probability
6	Dataset Factory · Trains	domain swap, same arch

SportMind AI

Upload a match. Get intelligence.

One Flash architecture · every sport · every modality.

Built on RunPod Flash serverless GPU · the ask: GPU credits + a pilot team
